

Draw the Treehouse You Would Build

A bit of a stretch · Either · Grown-up nearby · Ages 6–10 · 30 min

Brought to you by Chike — “Hmmm, what should we create today?”

Plan a treehouse properly, on paper, with measurements you actually worked out.

WHAT YOU NEED

- Paper, ideally squared
- A ruler
- Pencil first, marker second
- A tape measure if you have one

BEFORE YOU START

Measuring a real tree stays on the ground.
Nobody climbs to check anything.

How to make it

- 1 Measure something you know well: your bed, a doorway, the kitchen table. Write the numbers down.
- 2 Decide how big one square on your paper is going to be. One square equals half a meter works well.
- 3 Draw the floor of your treehouse to that scale. Use your bed measurement to check it is big enough to lie down in.
- 4 Add the walls and label where the door and windows go.
- 5 Draw a second picture from the side, showing how high it sits and how you get up.
- 6 Write a materials list at the bottom, with how much of each thing you would need.

TALK ABOUT IT

Which measurement surprised you the most when you wrote it down?

TRY THIS TOO

Draw the same treehouse for somebody with different needs: a ramp instead of a ladder, a wider door, a lower window.

DID YOU KNOW? · SHAPES & STRUCTURES

A scale drawing shrinks something big without changing its shape. When every measurement shrinks by the same amount, the drawing stays true. That is how a builder can hold a whole house on one page and still know exactly where the door goes.
