

# Make an Origami T-Rex

A bit of a stretch · Indoors · Grown-up nearby · Ages 6–10 · 20 min

Brought to you by Corey — “Every toy is a character waiting for a story.”

Fold a plain sheet of paper into a stomping origami T-Rex, one crease at a time, then draw on its face.

## WHAT YOU NEED

- square sheet of paper (or a rectangle trimmed to a square)
- Markers or crayons for the face
- A flat table to press creases on

## BEFORE YOU START

Press creases with a flat finger, not a fingernail, to avoid a papercut.

## How to make it

- 1 Start with a square of paper. Fold it corner to corner both ways, then unfold, so you have an X crease.
- 2 Fold the two side corners in to meet the center line, making a kite shape for the head and jaw.
- 3 Fold the bottom point up to form the T-Rex's chest, then fold it back down slightly for a stepped jaw.
- 4 Fold the whole shape in half along the center crease so the two sides meet.
- 5 Fold each side out to form a small back leg, so the model can stand on its own.
- 6 Draw on eyes, nostrils, and teeth, then make it stomp across the table.

## TALK ABOUT IT

Which fold was the trickiest to get right? What did you do differently the second time?

## TRY THIS TOO

Fold a second, smaller T-Rex from a smaller square, and see how the same folds shrink down.

## DID YOU KNOW? · NATURE & ANIMALS

A T-Rex used its tail for balance. Tyrannosaurus rex walked with its body almost level with the ground and its long tail stretched out behind it. The tail balanced the weight of its huge head, the same way your arms help you balance when you walk along a narrow line.
